Earthquake Early Warning

or "緊急地震速報 (Kinkyu Jishin Sokuba)" in Japanese

A New Advance Earthquake Alert

Starting 1 October 2007

As of 1 October 2007, the Japan Meteorological Agency (JMA) will start the Earthquake Early Warning, a new service that advises of strong tremors before they arrive.

- The Earthquake Early Warning system automatically calculates the focus and magnitude of the earthquake and estimates the seismic intensity for each location by detecting the quake (i.e. the P-wave, or the preliminary tremor) near its focus. An Earthquake Early Warning is then given a matter of seconds (i.e. a few seconds to a few tens of seconds) before the arrival of strong tremors (i.e. the S-wave, or principal motion).
- Earthquake Early Warnings will be provided through various media outlets such as TV and radio.
- Please note that strong tremors may arrive at the same time as the Earthquake Early Warning in areas that are close to the focus of the earthquake.

2007

Earthquakes issued EEW

1. 2008/4/28 Miyakojima-oki
11 seconds (too large estimate)
2. 2008/5/8 Ibaragiken-oki
58 seconds
3. 2008/6/14 Iwate-Miyagi Inland
5 seconds
4. 2008/6/14 Iwate-Miyagi aftershock
8 seconds
5. 2008/7/8 Okinawa-honto-oki
14 seconds
6. 2008/7/24 Northern Iwate
21seconds
7. 2008/9/11 Tokachi-oki
10 seconds

10-20sec to issue a warning

Summary

- Local seismic network
Install broadband seismometers in Kyoto
- Empirical relationship of magnitude and τ_c
Estimate magnitude from τ_c and P_d
- Develop a prototype system
Regional warning
Onsite warning (near-field term warning)

Strong Motion Seismometer

Tau_c Method

$$\tau_c = 2\pi \sqrt{\frac{\int_0^{\tau_0} u^2(t) dt}{\int_0^{\tau_0} \dot{u}^2(t) dt}}, \quad (1)$$

Tau_c Method:
Estimate magnitude from the
P-wave period parameter

Dataset

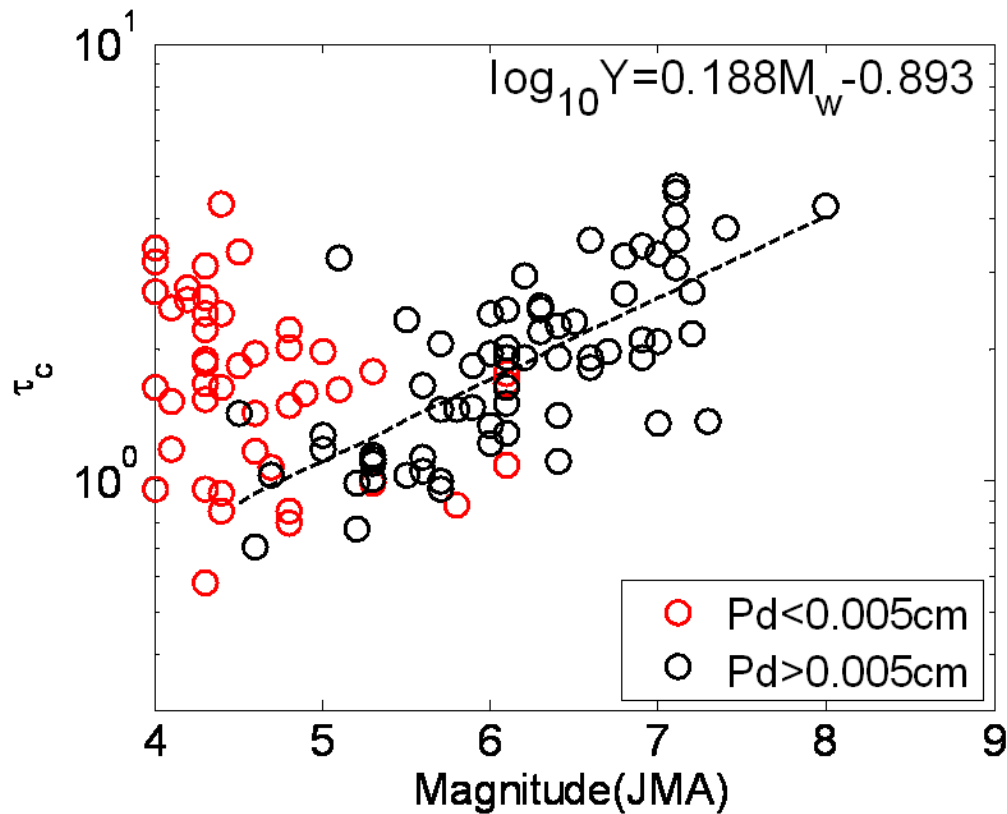

118 events
 $4 < M_{jma} < 8$
from 1996 to 2008
K-NET and KiK-net
records

40°

140°

Magnitude estimate from τ_c

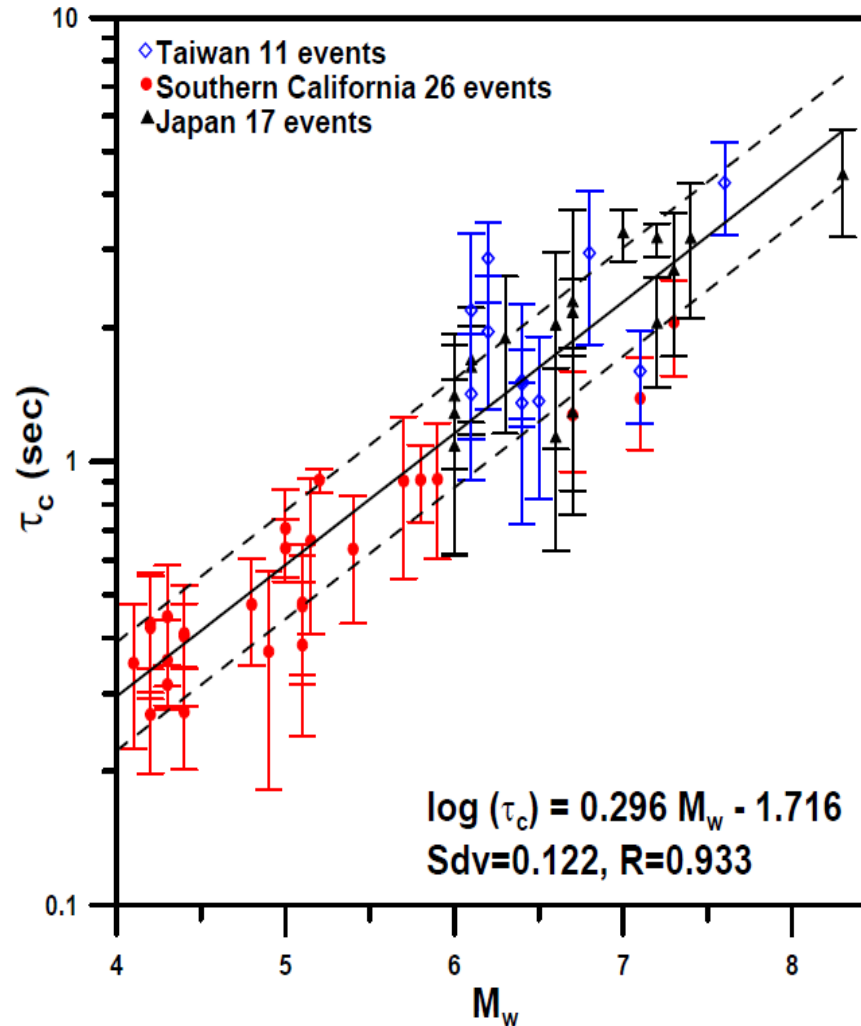

$$\log_{10}(\tau_c) = 0.188 M_w - 0.893 \text{ (Japan)}$$

Poor S/N ratio for small earthquake.

Magnitude estimate from τ_c

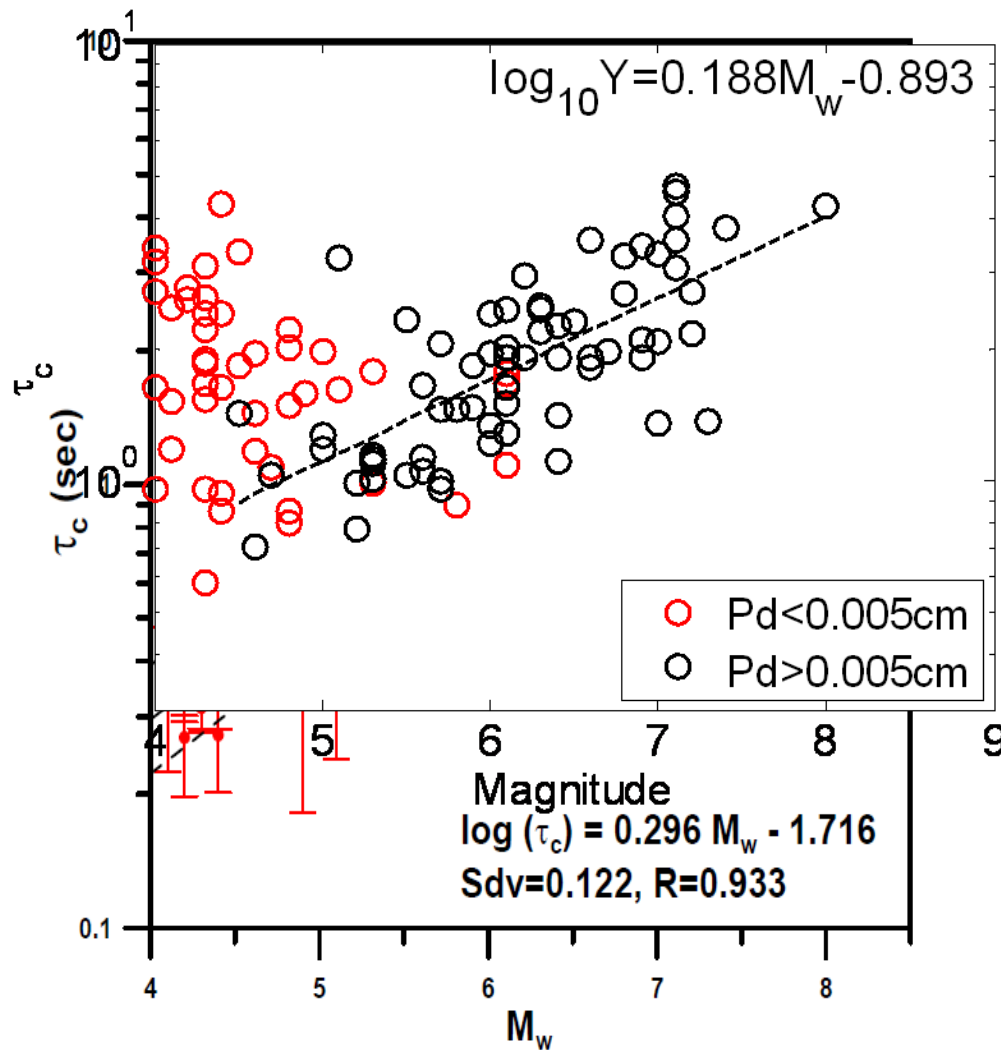

(Wu and Kanamori 2008)

$$\log_{10}(\tau_c) = 0.296 M_w - 1.462 \text{ (Taiwan, CA, and JPN)}$$

Magnitude estimate from τ_c

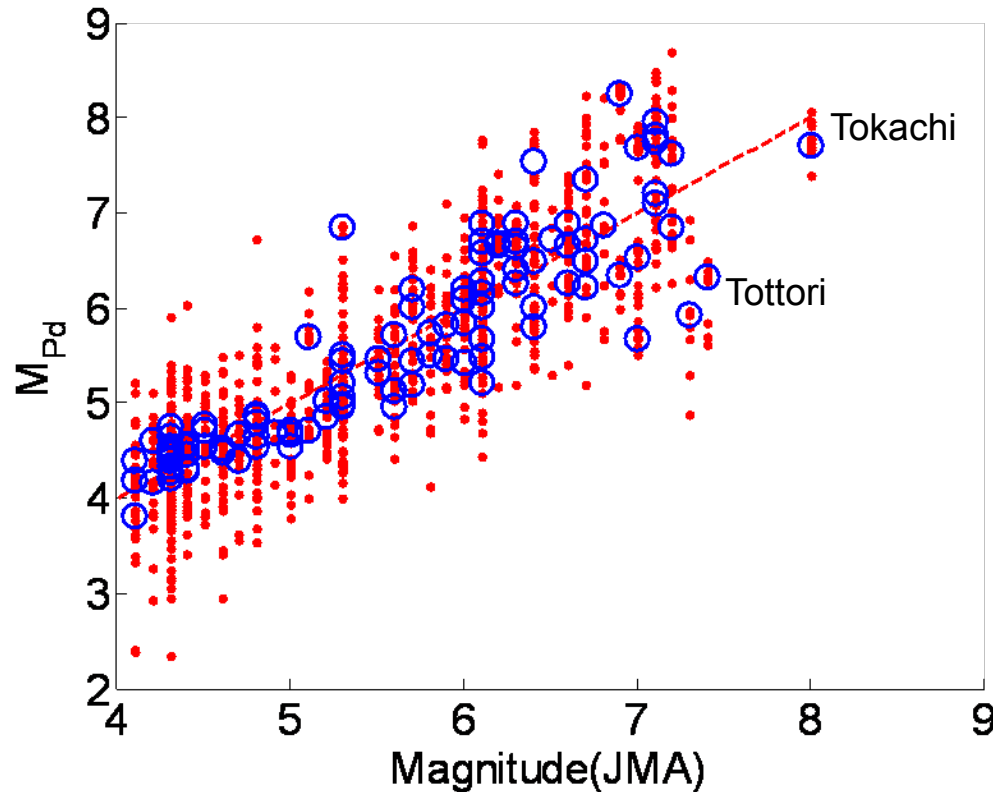

(Wu and Kanamori 2008)

Different slope (JMA Magnitude, uncertainty of large EQ)

Magnitude estimate from Pd

(Wu and Zhao 2006)

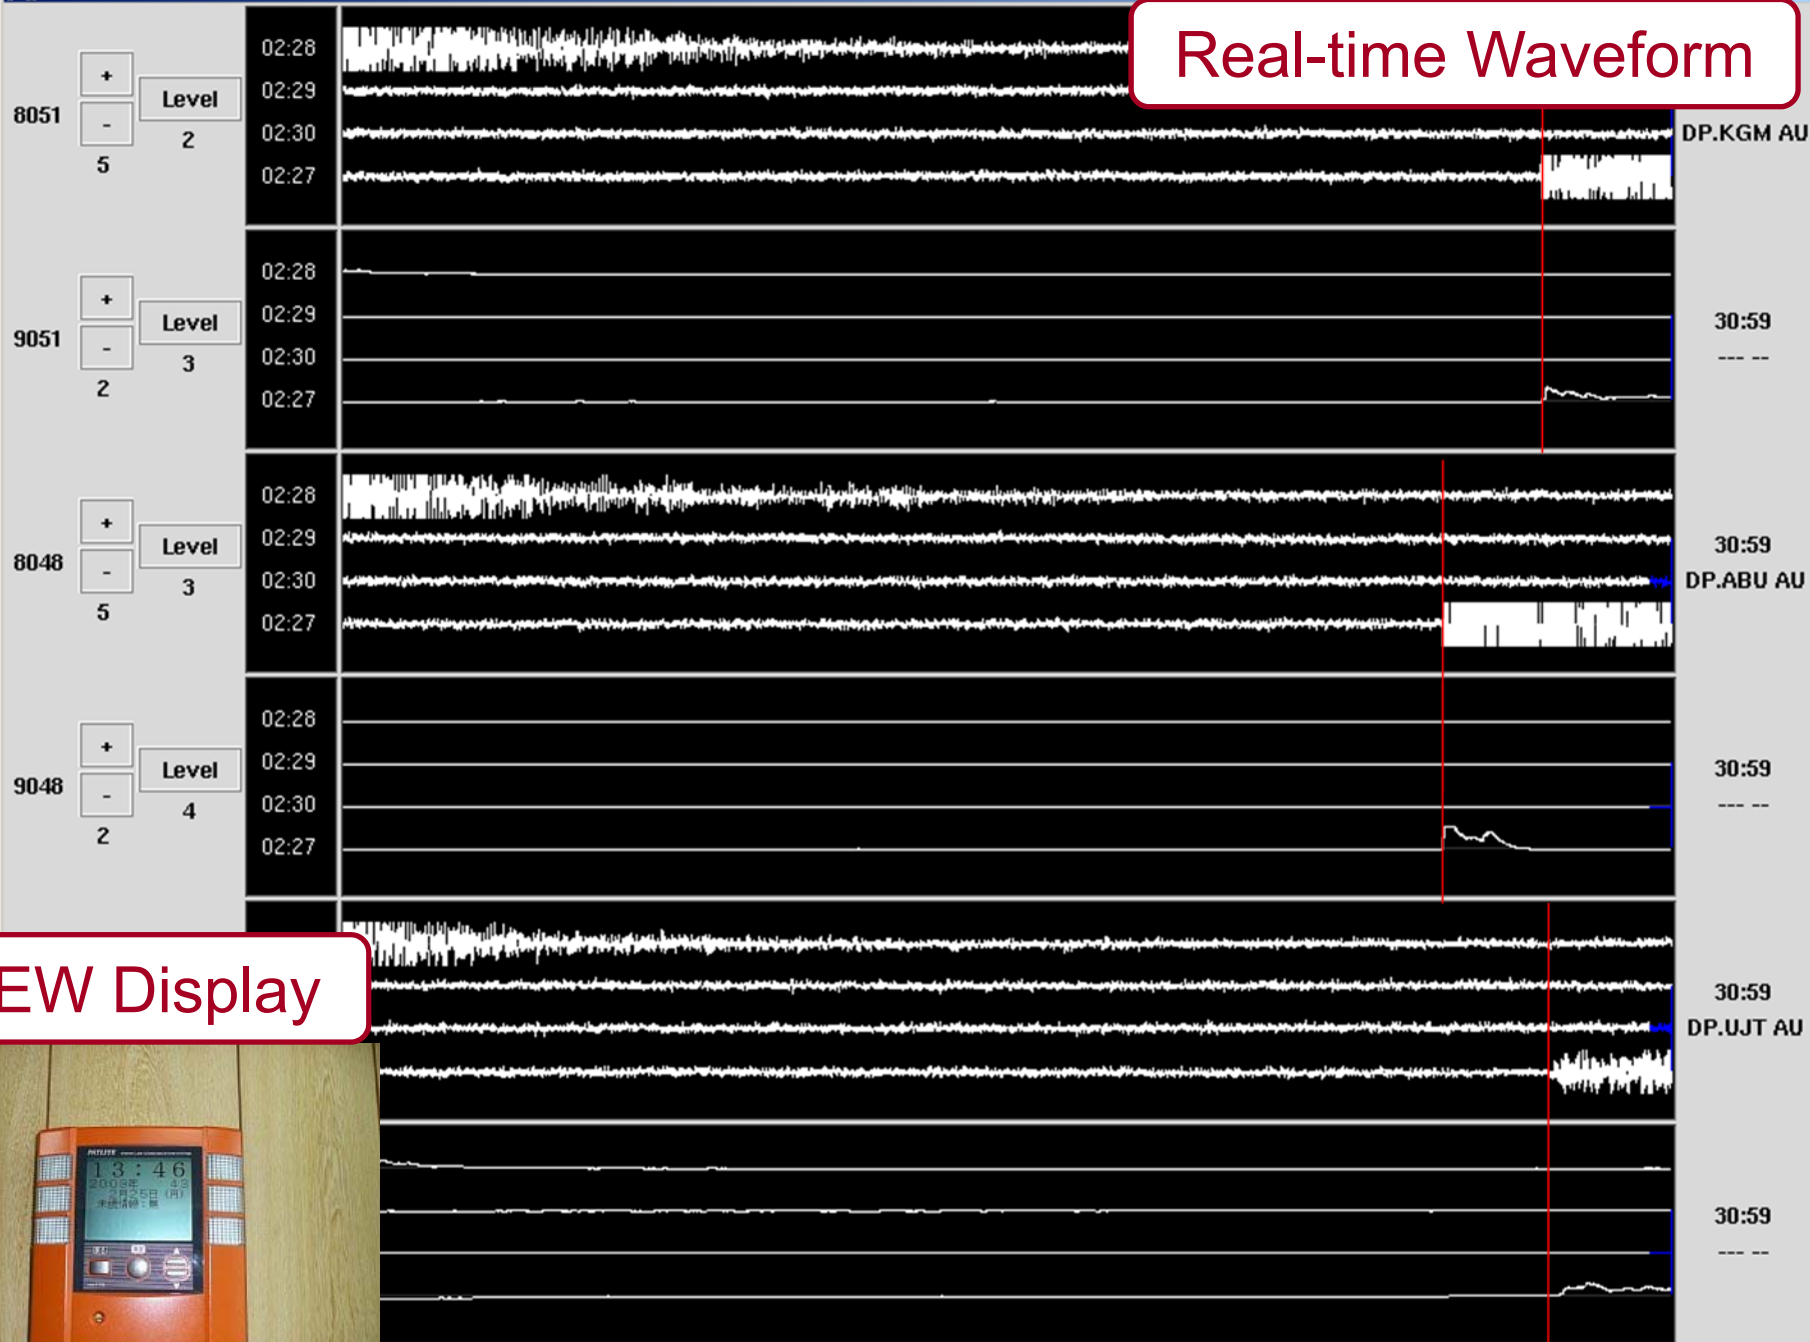

$R < 30\text{km}$ or
closest 10 station

$$M_{Pd} = 5.164 + 1.652 \log_{10} (Pd) + 1.715 \log_{10} (R) \text{ (Japan)}$$

$$M_{Pd} = 4.748 + 1.371 \log_{10} (Pd) + 1.883 \log_{10} (R) \text{ (California)}$$
